We used **netem** tool to emulate various network conditions to see the resilience of our protocol [\[networking.netem\]](http://networking.netem).

We tweak certain parameters to see the effect of it on our protocol, ceteris paribus. The file size we have used is 32316 bytes. The window size is 4 packets. The maximum segment size is 1024 bytes. The throughput values are given after varying each of the parameters.

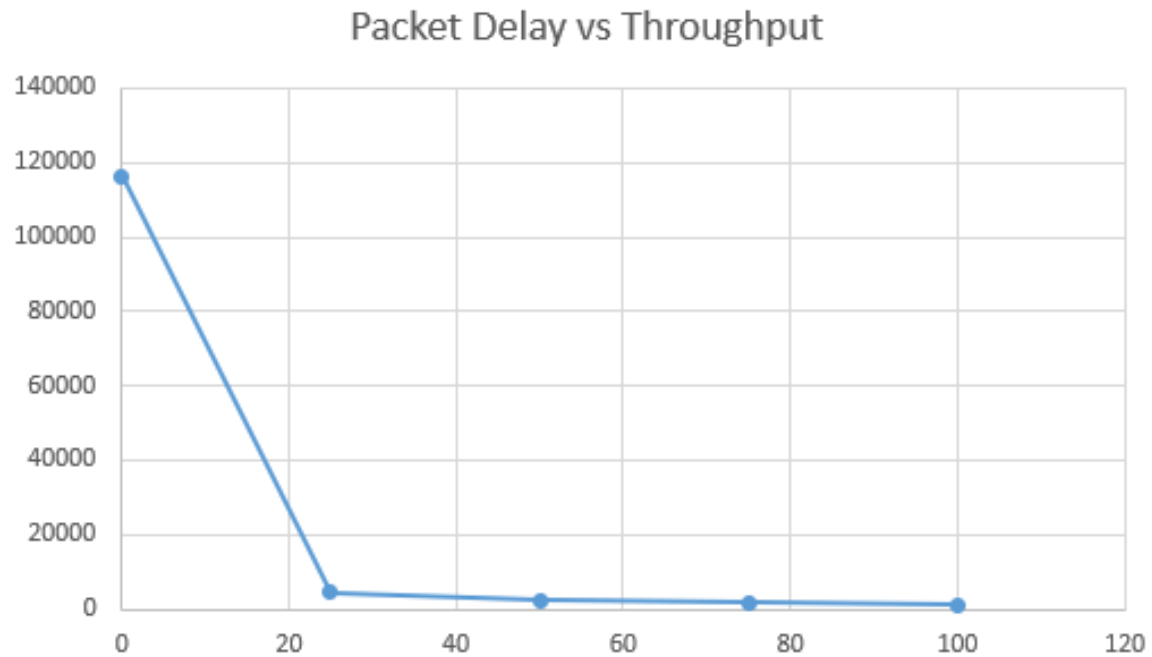

### Packet Loss

Rate	0%	3%	5%	7%	10%
Time taken (in seconds)	0.278023481 36901855	16.58825922 012329	33.42266106 60553	45.48463606 8344116	54.62892627 7160645
Throughput (Bytes/sec)	116234.787	1948.125	966.8889	710.4817	591.5547

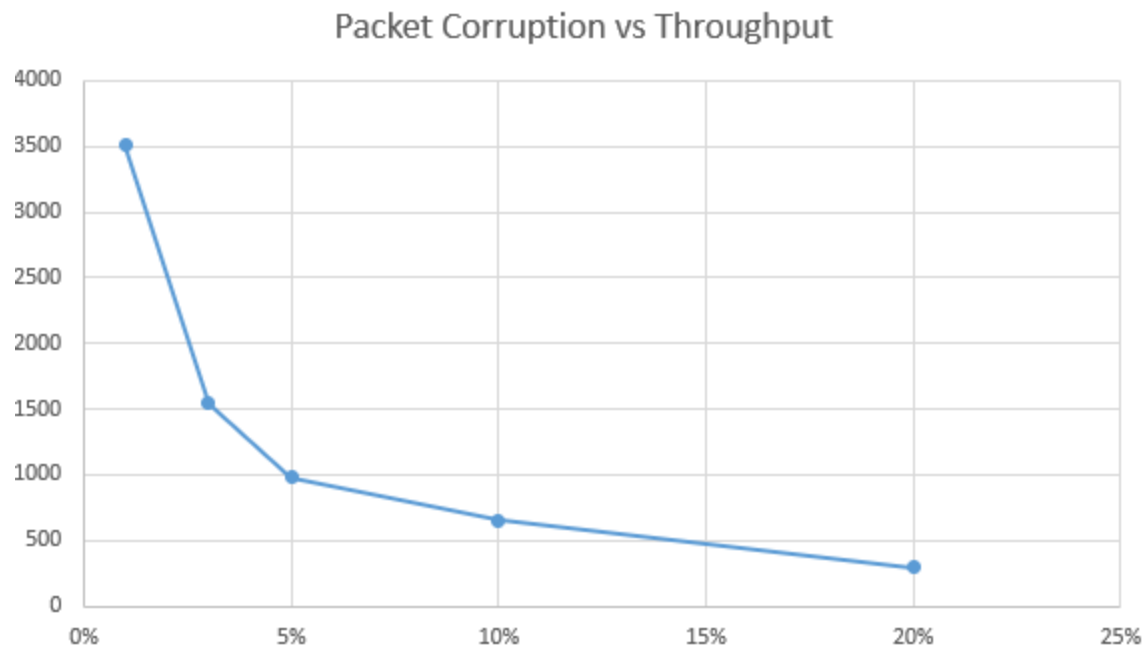

## Delay

Delay	0ms	25ms	50ms	75ms	100ms
Time taken (in seconds)	0.27802348136901855	7.073549032211304	13.417979955673218	19.786348342895508	26.132922649383545
Throughput (Bytes/sec)	116234.787	4568.569	2408.41	1633.247	1236.601

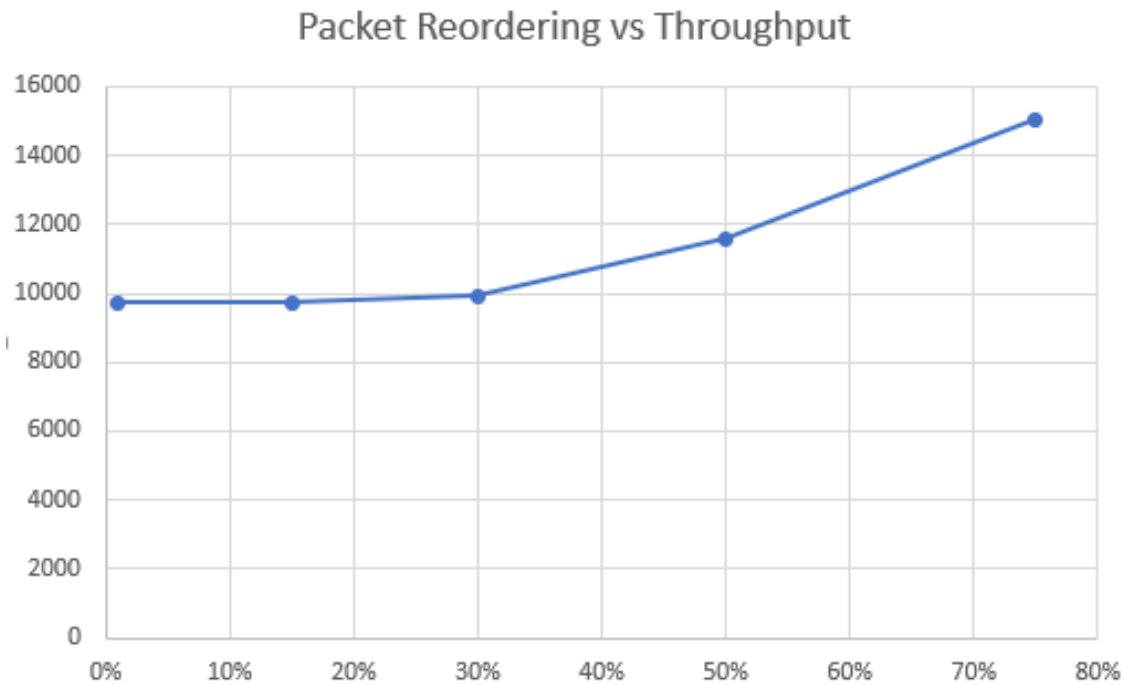

### **Packet Corruption**

Rate	1%	3%	5%	10%	20%
Time taken (in seconds)	9.221344233	20.9524	32.91916	49.65391	109.745
Throughput (Bytes/sec)	3504.47821760052	1542.35288233202	981.677628388795	650.824821303877	294.464550631917

### Packet Reordering (10 ms delay)

Rate (% of packets, % of corr)	1%,50%	15%,50%	30%,50%	50%,50%	75%,50%
Time taken (in seconds)	3.320806503 3	3.321965456	3.259103536 6	2.791087865 8	2.148014783 9
Throughput (Bytes/sec)	9731.370969 1	9727.975931 1	9915.610117 0	11578.28114 1	15044.58919 1

### **Some commands in netem:**

- `sudo tc qdisc show dev lo` - shows all active rules
- `sudo tc qdisc del dev lo root` - deletes all active rules
- `sudo tc qdisc add dev lo root netem loss x%` - adds x% packet loss
- `sudo tc qdisc add dev lo netem delay xms` - adds x ms delay
- `sudo tc qdisc add dev lo root netem corrupt x%` - adds x% corrupted packets
